

Automation with Selenium

Assignment 1: The Multi-Locator Challenge

1. Problem Statement: -

Navigate to a login page (e.g., SauceDemo). Find and interact with the username field using By.ID, the password field using By.NAME, and the login button using By.XPATH. Assert that the resulting page URL contains /inventory.html after logging in.

2. Objective: -

To master element identification using different locators (ID, NAME, XPATH) and perform basic browser validation and assertions.

3. Tools, Software, and Concepts Used: -

Python 3.x, Selenium WebDriver, Chrome/ChromeDriver, pytest (optional for assertions).

4. Source Code / Implementation: -

```
from selenium import webdriver
from selenium.webdriver.common.by import By
import time
driver = webdriver.Chrome()
driver.get("https://www.saucedemo.com/")
time.sleep(2)
driver.find_element(By.ID, "user-name").send_keys("standard_user")
driver.find_element(By.NAME, "password").send_keys("secret_sauce")
driver.save_screenshot("login_page_screenshot.png")
print("Login page screenshot saved successfully!")
driver.find_element(By.XPATH, "//input[@id='login-button']").click()
time.sleep(2)
assert "/inventory.html" in driver.current_url
print("Login successful and URL validated!")
time.sleep(10)
driver.quit()
```

5. Output & Screenshots: -

Fig.1: Login page is visible

Fig.2: Product inventory is visible

6. Result, Observation, and Conclusion: -

- Result: The elements were successfully located using ID, NAME, and XPATH.
- Observation: The login was successful and the assertion passed, verifying the correct redirect.
- Conclusion: Utilizing a mix of locators allows for robust script creation depending on the attributes available on the DOM.
