

Automation with Selenium

Assignment 3: Dynamic Dropdowns & Checkboxes

1. Problem Statement: -

Open a form containing multiple checkboxes and a search-as-you-type autocomplete dropdown. Select specific checkboxes, verify their state using `.is_selected()`, type into the dropdown, and loop through the suggested results to select a matching option.

2. Objective: -

To handle form elements like checkboxes and dynamic auto-suggest dropdowns using iteration and conditionals.

3. Tools, Software, and Concepts Used: -

Python 3.x, Selenium WebDriver.

4. Source Code / Implementation: -

```
from selenium import webdriver
from selenium.webdriver.common.by import By
import time
driver = webdriver.Chrome()
driver.get("https://rahulshettyacademy.com/AutomationPractice/")
checkbox = driver.find_element(By.ID, "checkBoxOption1")
checkbox.click()
assert checkbox.is_selected(), "Checkbox is not selected!"
driver.find_element(By.ID, "autocomplete").send_keys("ind")
time.sleep(2)
options = driver.find_elements(By.CSS_SELECTOR, "li.ui-menu-item div")
for option in options:
    if option.text == "India":
        option.click()
        break
time.sleep(2)
print("Checkbox and Dropdown handled successfully.")
time.sleep(10)
driver.quit()
```

5. Output & Screenshots: -

Fig.1: Dropdown is visible

Fig.2: "India" is selected and checkbox is checked

6. Result, Observation, and Conclusion: -

- Result: The checkbox state was accurately verified, and the dynamic dropdown was successfully handled.
- Observation: Iterating through a list of WebElements allows for dynamic selection based on text rather than hardcoded indexes.
- Conclusion: Handling dynamic UIs requires waiting for elements to render and verifying state via element properties.
